

ABSTRACT

Antialiased lines are classified according to their orientation, e.g. as x-major or y-major depending whether the x or y extent of the line is larger. Different subpixel sampling patterns are used for different
5 lines, in accordance with this classification. This permits antialiased rendering to achieve increased visual quality of the line without adding in more sample points.

Antialiased lines are classified according to their orientation, e.g. as x-major or y-major depending whether the x or y extent of the line is larger. Different subpixel sampling patterns are used for different lines, in accordance with this classification. This permits antialiased rendering to achieve increased visual quality of the line without adding in more sample points.
